

JavaScript Beginner Practice Questions (Phase -2) Sheet - 2

1. Array

Intermediate

Create an array of 5 favorite movies and print all values.

Hint: Use indexing

Hard

Create an array containing numbers, strings, boolean, and another array. Print only the nested array value.

Hint: Mixed data types + nested indexing

2. Indexing in Array

Intermediate

Print the first and last element of an array.

Hint: Use `0` and `length - 1`

Hard

Swap the second and second-last element using indexing.

Hint: Use temporary variable

3. Multi-Dimensional Arrays

Intermediate

Create a 2D array and print all first elements of inner arrays.

Hint: Double indexing

Hard

Find the sum of all diagonal elements in a 3×3 matrix.

Hint: Same row and column index

4. length

Intermediate

Find total elements in an array without counting manually.

Hint: Use `.length`

Hard

Create a function that checks whether array length is even or odd.

Hint: Use modulus operator

5. push()

Intermediate

Add 3 new elements at the end of array.

Hint: Use `push()`

Hard

Add elements dynamically inside loop from another array.

Hint: Loop + push

6. pop()

Intermediate

Remove last element and print removed value.

Hint: Store `pop()` result

Hard

Keep removing elements until array becomes empty.

Hint: Use `while` loop

7. unshift()

Intermediate

Add one username at beginning of array.

Hint: Use `unshift()`

Hard

Insert multiple elements at beginning without replacing existing ones.

Hint: Multiple arguments

8. shift()

Intermediate

Remove first element from array.

Hint: Use `shift()`

Hard

Remove first element repeatedly until only 2 elements remain.

Hint: Loop + length check

9. splice()

Intermediate

Remove 2 elements from middle of array.

Hint: `splice(start, deleteCount)`

Hard

Replace 3 middle elements with 5 new values.

Hint: Use insertion with splice

10. reverse()

Intermediate

Reverse an array using method.

Hint: Use `reverse()`

Hard

Reverse only first half of array.

Hint: Manual swapping

11. sort()

Intermediate

Sort numbers in ascending order.

Hint: Compare function

Hard

Sort array so even numbers come first and odd later.

Hint: Custom compare logic

12. slice()

Intermediate

Extract first 4 elements into new array.

Hint: Use `slice()`

Hard

Create a copy excluding first and last element.

Hint: Use start and end indexes

13. concat()

Intermediate

Merge two arrays.

Hint: Use `concat()`

Hard

Merge 3 arrays and remove duplicate values.

Hint: Combine + loop/includes

14. includes()

Intermediate

Check whether `"apple"` exists in array.

Hint: Use boolean result

Hard

Check if all elements of one array exist inside another.

Hint: Loop + includes

15. indexOf()

Intermediate

Find index of `"Rahul"` in array.

Hint: Use `indexOf()`

Hard

Find all positions of repeated number `5`.

Hint: Loop through entire array

16. join()

Intermediate

Convert array into comma separated string.

Hint: Use `join(",")`

Hard

Convert array into sentence format.

Hint: Join with spaces

17. for loop

Intermediate

Print all array elements using loop.

Hint: Loop through indexes

Hard

Print elements at only even indexes.

Hint: Increase loop smartly

18. for...of

Intermediate

Print all values using `for...of`.

Hint: Direct value iteration

Hard

Count vowels from array of characters.

Hint: Use conditions inside loop

19. Reference Behaviour of Array

Intermediate

Assign one array to another variable and modify second one.

Hint: Observe original array

Hard

Create true copy so original array does not change.

Hint: Use spread operator

20. Spread Operator

Intermediate

Copy array into new array.

Hint: Use `...`

Hard

Merge arrays and add extra values in between.

Hint: Combine spread carefully
